Demonstration of Proposed Features

Date	28 september 2026
Team ID	6ab2215e11b716a3e52c637d
Project Name	Auto ticket classification using flow designer
Maximum Marks	5 Marks

Proposed Feature	**Demonstration / Description**
Automatic Ticket Classification	Demonstrate how incoming tickets are automatically classified based on predefined conditions

Auto Ticket Classification Using Flow Designer

The proposed system automates the classification of incoming support tickets using **Flow Designer**. When a new ticket is created, the flow automatically analyzes the ticket information, such as the subject, description, category, and priority indicators.

Based on predefined rules and conditions, the system identifies the appropriate **ticket category, subcategory, priority, and assignment group**. The classified ticket is then automatically routed to the relevant team for further action.

The automated flow reduces manual classification effort, improves consistency in ticket handling, and helps ensure that tickets reach the appropriate support team quickly. It also minimizes errors caused by manual categorization and improves the overall efficiency of the ticket management process.

Key features demonstrated:

- Automatic detection of newly created tickets.
- Analysis of ticket details and keywords.
- Automatic assignment of category and subcategory.
- Priority identification based on predefined conditions.
- Automatic routing to the appropriate assignment group.
- Reduction of manual intervention and classification errors.
- Faster and more consistent ticket processing.
