Problem-Solution Fit Canvas 2.0

Auto Ticket Classification Using Flow Designer | ITSM Automation Framework

1. CUSTOMER SEGMENT (CS)

Target Users: End users, employees, and internal stakeholders across departments (HR, Finance, Operations, IT Support) who raise incidents or service requests.
Scope: All internal employees utilizing the ServiceNow enterprise portal for technical assistance.

6. CUSTOMER CONSTRAINTS (CC)

Data Variations: Vague ticket descriptions, typos, or lack of technical context from users.
Rule Boundaries: Overlapping categories where a single issue might map to multiple subcategories, requiring strict fallback logic.

3. AVAILABLE SOLUTIONS (AS)

Automation Tools: ServiceNow Flow Designer utilizing custom flow logic, trigger conditions, and decision tables.
Advanced Intelligence: Integration with Predictive Intelligence or Machine Learning categorization models.

2. JOBS-TO-BE-DONE / PROBLEMS (JBP)

Core Problem: Manual categorization and routing of incoming IT support tickets consume significant agent bandwidth and cause resolution delays.
Goal: Automatically analyze incoming tickets and assign correct categories, subcategories, and priorities instantly.

9. PROBLEM ROOT CAUSE (RC)

Operational Bottlenecks: Manual triage creates human error, misrouted tickets between support groups, SLA breaches, and increased administrative overhead.

7. BEHAVIOUR (BE)

User Patterns: Common terminology, repeating phrasing, and frequent keywords used during ticket submission (e.g., "VPN error", "Password reset", "Printer offline").

3. TRIGGERS (TR)

Event Initiation: Flow triggers automatically when a new record is inserted into the Incident [incident] or Task [task] table via portal, email, or chat.

10. YOUR SOLUTION (SL)

Workflow Execution: Design a robust Flow in ServiceNow Flow Designer to evaluate short descriptions, apply conditional matching rules, and update category fields automatically.

8. CHANNELS OF BEHAVIOUR (CH)

Ingestion Points:
- ServiceNow Self-Service Portal
- Virtual Agent / Chatbots
- Inbound Email Integration

4. EMOTIONS BEFORE / AFTER (EM)

Before Automation: Frustrated users facing delays; overwhelmed service desk agents burdened with manual triage and misrouted ticket reassignments.
After Automation: Delighted users receiving rapid resolutions; streamlined agent workflows with high accuracy, leading to improved SLA compliance and employee satisfaction.
