Project Design Phase
Proposed Solution Template

Date	28 September 2026
Team ID	6ab2215e11b716a3e52c637d
Project Name	Auto ticket classification using flow designer
Maximum Marks	2 Marks

Proposed Solution Template:

Project team shall fill the following information in the proposed solution template.

S.No	Parameter	Description
1	Problem Statement (Problem to be solved)	New hires and existing employees face long, unclear delays when requesting a standard laptop, because the request, manager approval, stock check, and vendor ordering are all handled manually over email/phone with no automated workflow or status visibility.
2	Idea / Solution description	An automated Flow Designer workflow: employee submits a request via a self-service Service Catalog item, the flow auto-routes it for manager approval, auto-checks stock, auto-creates a fulfilment task or a vendor purchase order accordingly, and sends status notifications at each step through to delivery.
3	Novelty / Uniqueness	Fully automated, rule-based routing from request to delivery (no manual email hand-offs); real-time stock-aware branching between in-house fulfilment and vendor procurement; a live dashboard giving end-to-end visibility that the current manual process lacks.
4	Social Impact / Customer Satisfaction	Faster, transparent onboarding experience for new employees; reduced frustration and follow-up effort for staff and managers; consistent standard configurations for all employees; less manual workload and fewer errors for the IT team.
5	Business Model (Revenue Model)	Internal IT productivity solution — cost savings from reduced manual processing time, fewer procurement errors/duplicate orders, and faster asset turnaround; can be offered as a reusable Flow Designer template/module for other IT asset request types.
6	Scalability of the Solution	The same flow structure can be extended to other IT assets (monitors, phones, software licenses) and other departments; scales across multiple locations/teams by simply adding approval hierarchies and inventory sources without redesigning the core workflow.
